

# AICE: Rosslyn's AI Classification Engine

Your data. Your taxonomy. No training, just results.

OVERVIEW

## What is AICE?

AICE is Rosslyn's AI-powered classification engine that enables accurate, high-speed categorization of spend data into any taxonomy—standard or custom—without the need for pretraining. Designed for enterprise-scale workloads, AICE processes millions of lines per day and adapts to your business's unique terminology.

FUNCTIONALITY

## How it Works.

AICE takes all data available for a line of spend, no matter how sporadic, and processes it through a series of AI models. These models first identify the nature of the spend and then find the best fit within the chosen taxonomy. By running line-by-line, AICE ensures accuracy and granularity in classification, avoiding the pitfalls of blanket rules by supplier. What's more, AICE runs every time data is refreshed, ensuring spend is accurately classified in real-time.

APPLICATIONS

## Use Cases

Harmonizing complex spend under a unified taxonomy

Enabling granular category management

Supporting ESG with accurate categorization

VALUE

## Key Benefits

01

Accelerates time-to-insight with automated classification

02

Improves accuracy and consistency across global disparate datasets

03

Supports any taxonomy—UNSPSC, custom, or industry-specific

04

Effortlessly manages inconsistent source data

05

Massively reduces manual review and rule management effort

IMPACT

## Why it Matters.

Without accurate classification, spend data is difficult to analyze and provides little insight. Leveraging AICE to rapidly classify data into business-aligned terminology accelerates time to genuine spend insights, empowering them to drive substantial savings.
