Rosslyn Supplier Enrichment
Know who you're really buying from.

What is it?

When supplier names scattered across ERPs and business units are misspelled, abbreviated, duplicated, they destroy the accuracy of your spend data. Rosslyn brings clarity by unifying these records, mapping them to their ultimate parent companies, and enriching them with ESG data. The result? One supplier view, total spend insight, and a clearer understanding of the impact behind every penny spent.

FUNCTIONALITY

How it Works.

When Rosslyn loads new suppliers from source systems, they are run through the Supplier Enrichment process. This process executes a fuzzy search of the supplier name against Dun & Bradstreet's global company information database. When a match is found, the supplier record is updated with the registered business name, ultimate parent name, line of business and more. These registered business names can then be mapped to data from ESG providers to unlock a full picture of each supplier.

VALUE

Key Benefits

01 Normalize supplier names into unified distinct records

02 Match suppliers to their ultimate global parent company

03 Load ESG ratings and scores against suppliers for deeper analysis

APPLICATIONS

Use Cases

- Harmonizing suppliers across complex organizational structures
- Obtaining a true picture of spend with global suppliers
- Roll up spend to ultimate parent companies
- Understand the full picture of all suppliers

IMPACTT

Why it Matters.

It's a common theme to see the same supplier listed with different spelling, abbreviations and suffixes across different business units or different ERPs. This messy data makes analysis extremely difficult, as one real supplier is split into many different supplier records. By normalizing these suppliers into one, and mapping their ultimate parent companies, seeing total spend by supplier is made possible. What's more, by further enriching the data with ESG information, procurement and ESG teams can see the full picture of the impact of their spend.
